## 1 – INTRODUCTION

### 1.1 Background

The project corridor for the Eastonville Road Project extends from McLaughlin Road north to Latigo Boulevard as shown in **Figure 1.1**. As shown, the project corridor is divided into three segments, with each segment identified as either a Phase I or Phase II study element. The Phase I segment, between Snaffle Bit Road and the proposed Rex Road, has the highest priority for improvements needed to serve near-term development along the corridor. There are two Phase II segments: one between McLaughlin Road and Snaffle Bit Road and another between proposed Rex Road and Latigo Boulevard. A mix of generally built-out residential neighborhoods and a few scattered, business uses line the southernmost Phase II segment. The commercial area in Falcon is located immediately south of this Phase II segment. Land use adjacent to the northernmost Phase II project segment is currently undeveloped.

Established residential neighborhoods that are located along the Eastonville Road corridor include: Woodmen Hills, Windwalk, The Vistas, Metropolitan Club, and portions of Meridian Ranch and 4-Way Ranch. By 2040, the build-out of planned developments along the Phase II study segment, (including Waterbury, Grandview Reserve, Rolling Hills, and Meridian Ranch Phases IV, V, and VI) will generate significant levels of additional traffic that will use Eastonville Road. As a result, the Phase I corridor north of Stapleton Road is forecast to experience a nearly thirtyfold increase in traffic, while the southernmost Phase I segment of the corridor is forecast to experience a more modest twofold increase in traffic (Felsburg Holt & Ullevig 2016, Map 9: Existing and 2040 Traffic Volumes, 40).

**Figure 1.1. Vicinity Map**

## 1.2 Purpose and Objectives

The Eastonville Road Project Traffic Impact Study (TIS) is part of a broader, corridor-specific investigation that is needed to confirm the functional classification of the roadway and to identify both linear and intersection specific improvements that will be needed to improve corridor safety and serve current and future corridor travel demand. To address this overarching purpose, this TIS includes: an evaluation of 2020 existing corridor traffic operations and carrying capacity; a signal warrants analysis for the intersection at Stapleton Road intersection; All Way Stop Control (AWSC) analyses for the intersections at Judge Orr Road and Stapleton Road; forecasts of 2040 intersection traffic volumes with full build-out of planned developments; and evaluations of traffic operations for 2020 conditions with near-term improvements to the Eastonville Road/Stapleton Road intersection and 2040 conditions with and without the implementation of long-term, intersection-specific improvements.

## 1.3 Intersection Analysis Methodology

### 1.3.1 Traffic Operations

The traffic operations analysis addressed unsignalized and signalized intersection operations using the procedures and methodologies contained in the Transportation Research Board's *Highway Capacity Manual Sixth Edition* (HCM6, Transportation Research Board, 2016) for weekday AM and PM peak hour traffic operations. Study intersection operations were evaluated using LOS calculations as analyzed in the Synchro software, version 10.

To measure and describe the operational status of the local roadway network and corresponding intersections, transportation engineers and planners commonly use the LOS grading system. LOS is a description of an intersection's operation, ranging from a LOS A (indicating free flow traffic conditions with little or no delay) to a LOS F (representing oversaturated conditions where traffic flows exceed design capacity, resulting in long queues and delays).

### Signalized Intersections

At signalized intersections, traffic conditions were evaluated using procedures and methodologies contained in the HCM6. The operational analysis uses various intersection characteristics (such as traffic volumes, lane geometry, and signal phasing) to estimate the intersection's volume-to-capacity (v/c) ratio. For signalized intersections, the HCM6 defines the LOS as the average delay per vehicle for the overall intersection. **Table 1.1** summarizes the relationship between delay and LOS for signalized intersections.

**Table 1.1. LOS Criteria for Signalized Intersections**

Level of Service	Interpretation	Control Delay (seconds/vehicle)
A	Progression is extremely favorable and most vehicles arrive during the green phase. Most vehicles do not stop at all. Short cycle lengths may contribute to low delay.	≤10
B	Good progression, short cycle lengths, or both. More vehicles stop than with LOS A.	>10 – 20
C	Fair progression, longer cycle lengths, or both. The number of vehicles stopping is significant, though many still pass through without stopping.	>20 – 35
D	Longer delays result from some combination of unfavorable progression, long cycle lengths, or high v/c ratios. Many vehicles stop.	>35 – 55
E	High delay values generally indicate poor progression, long cycle lengths, and high v/c ratios. Individual cycle failures are frequent occurrences.	>55 – 80
F	This level often occurs with over saturation when arrival flow rates exceed the capacity of the intersection. Poor progression and long cycle lengths may be major contributing factors to such delays.	>80

Source: Transportation Research Board. 2010, 19-2.

### Unsignalized Intersections

For unsignalized (all-way stop-controlled [AWSC] and side-street stop-controlled) intersections, the HCM6 was utilized. With this methodology, operations are defined by the average control delay per vehicle (measured in seconds) for each stop-controlled movement. The method incorporates delay associated with deceleration, acceleration, stopping, and moving up in the queue. For AWSC intersections, the HCM6 defines the LOS as the average delay per vehicle for the overall intersection. For side street stop-controlled intersections, LOS is reported for the approach with the highest average delay/vehicle. **Table 1.2** summarizes the relationship between delay and LOS for unsignalized intersections. Insufficient gaps of suitable size to allow minor street traffic demand to cross safely through a major traffic stream.

**Table 1.2. LOS Criteria for Two-Way Stop Controlled Intersections**

Level of Service	Interpretation	Control Delay (seconds/vehicle)
A	Little or no delay	0-10
B	Short traffic delays	>10-15
C	Average traffic delays	>15-25
D	Long traffic delays	>25-35
E	Very long traffic delays	>35-50
F	When demand volume exceeds the capacity of the lane, extreme delays will be encountered with queuing that may cause severe congestion affecting other traffic movements in the intersection. This condition usually warrants improving the intersection.	>50

Source: Transportation Research Board. 2010, 18-6.

Note: For two-way stop controlled (TWSC) intersections, level of service is determined by the control delay for each minor movement, LOS is not defined for the intersection as a whole.

#### 1.3.2 Significance Criteria

Colorado Department of Transportation (CDOT) minimum design criteria indicate intersections operate at an overall LOS D or better. El Paso County Transportation Impact Study Guidelines indicate that all county roads must maintain an overall LOS C or better and intersections should operate at an overall LOS D or better. CDOT minimum design criteria indicate intersections operate at an overall LOS D or better. The County TIS Guidelines also require more detailed analysis and consideration of mitigation improvements for the following conditions:

- Signalized Intersections: When the added project traffic causes an intersection to exceed the LOS standard or when the background traffic conditions (without project traffic) exceed the established LOS standards and the project traffic causes more than a 20 percent increase in the intersection delay.
- Unsignalized Intersections: When the queuing of traffic to adjacent intersections would create impeded traffic flows or excessive delays are determined to create potential safety problems. It is typical for an unsignalized intersection to notice delays higher than 35 seconds (LOS E) for a single approach without meeting signal warrants. In these cases a LOS E for a single movement at an unsignalized intersection may be tolerated on a short-term basis. Roundabout control may also be implemented to provide improved operations where signal warrants are not met.

#### 1.3.3 Traffic Signal Warrants

Traffic signal warrants analysis was conducted for the Eastonville Road/Stapleton Road intersection. Highway Capacity Software Version 7 (HCS7) was used for the analysis.

## 2 – EXISTING CONDITIONS

### 2.1 Roadway Classification

Eastonville Road is classified by the 2016 El Paso County Major Transportation Corridors Plan (MTCP) as a minor arterial. The roadway exists as a two-lane roadway with discontinuous segments of urban cross section (between Woodmen Hills Drive and Motley Road) and rural cross section (the remainder of the corridor). Within the urban section, the cross section varies, including: a two-lane section and left-turn lanes at selected intersections between Meridian Road and Woodmen Hills Drive; and a three-lane section with a two-way center turn lane between Woodmen Hills Drive and Snaffle Bit Road. The posted speed limit varies between 35 mph and 45 mph.

### 2.2 Traffic Volumes

Existing Average Daily Traffic (ADT) volumes vary along the corridor from a high of 2,600 ADT at the south end of the corridor to a low of 200 ADT at the north end of the corridor. Forecast 2040 traffic flows will show increases in both the northern and southern portions of the project corridor. Over the next 20 years it is expected that build-out of planned development will drive growth in traffic flows to approximately 4,800 ADT at the south end of the corridor and 5,400 ADT at the north end of the corridor.

### 2.3 Travel Patterns

Traffic flows through the intersection are directional. The heaviest flow pattern is southbound (SB) in the morning, reflecting journey to work trips. This flow pattern is reversed in the afternoon to a slightly lighter northbound (NB) flow that reflects journey home trips.

### 2.4 Pedestrian Activity

Pedestrian activity was recorded by traffic counts conducted in February and October 2020 at the Eastonville Road intersections at McLaughlin Road, Del Rio Road, Woodmen Hills Road, Motley Road and Judge Orr Road, Snaffle Bit Road, and Stapleton Road. The counts show that pedestrian crossing of the roadway is concentrated in locations that connect active pedestrian nodes that include Woodmen Hills Elementary School, Horseshoe Park, and an extensive neighborhood trail system with connection to the Rock Island Regional Trail that runs along the west side of US 24. The Eastonville Road neighborhood trail crossing, located to the south of Del Rio Road, is signalized and the Eastonville Road/Del Rio Road intersection has upgraded AWSC to facilitate crossing of Eastonville Road between Woodmen Hills Elementary School and neighborhoods on the east side of the roadway. The driveway for the Liberty Tree Academy is at Motley Road, forming a fourth leg to that intersection. Access to this K-12 private academy is primarily by vehicle versus bicycle and pedestrian modes. A planned future regional trail will run along the west side of the full Eastonville Road alignment.

### 2.5 Traffic Operations

The LOS and delay measures shown in **Table 2.1** are for 2020 existing traffic flows and existing roadway geometry and lane utilization with two exceptions, the Del Rio Road and Judge Orr Road intersections. These intersections currently operate under AWSC and were evaluated under both AWSC and TWSC with the intent of testing the feasibility of reverting to TWSC at either intersection. The analysis results show that all but one of the project corridor intersections, including those not specifically listed, currently operate at an acceptable LOS D or better. The exception is the intersection at Stapleton Road. This intersection currently operates under TWSC and experiences LOS f operations for the eastbound (EB) Stapleton Road minor street approach during the morning peak hour. To improve traffic operations, AWSC, signalization and a modern roundabout were evaluated as alternative near-term (2020) and long-term (2040) upgrade solutions. Additionally, the analysis shows that the Del Rio Road and Judge Orr Road intersections would operate at a LOS b and LOS c, respectively, under TWSC during both the AM and PM peak hours.

**Table 2.1. 2020 Existing Conditions Traffic Operations Summary**

Control	Intersection	LOS/Delay [in seconds/vehicle] (Critical Movement)	
		AM Peak Hour	PM Peak Hour
TWSC	Eastonville Road & McLaughlin Road	d / 28.0 (NB THRU/LT)	c / 20.6 (NB THRU/LT)
AWSC	Eastonville Road & Del Rio Road	A / 9.7	B / 10.8
TWSC	Eastonville Road & Del Rio Road	b / 13.3 (EB Approach)	b / 14.0 (WB Approach)
TWSC	Woodmen Hills Drive & Eastonville Road	b / 12.9 (WB Approach)	b / 14.2 (WB Approach)
TWSC	Motley Road & Eastonville Road	c / 16.3 (WB LT)	b / 10.8 (WB LT)
AWSC	Eastonville Road & Judge Orr Road	B / 13.0	B / 10.9
TWSC	Eastonville Road & Judge Orr Road	c / 23.5 (WB LT)	c / 21.8 (WB THRU)
TWSC	Eastonville Road & Snaffle Bit Road	b / 10.9 (EB)	a / 9.6 (EB)
TWSC	Eastonville Road & Stapleton Road	f / 66.0 (EB)	b / 14.7 (WB THRU/LT)
TWSC	Eastonville Road & Londonderry Road	c / 16.0 (EB LT)	b / 13.3 (EB LT)
TWSC	EPC Regional Park Entrance	a / 8.3 (EB Approach)	a / 8.4 (EB Approach)

## 3 – TRAVEL DEMAND FORECASTS

### 3.1 Methodology

Forecasts for 2040 total traffic volumes were developed using a synthesis of historic trends-based methods and regional travel model-based methods that incorporated estimates of development site-generated traffic in a consistent manner. See [Appendix A](#) for traffic counts and calculations.

### 3.2 2040 Traffic Forecasts

TIS submittals for the Rolling Hills, Waterbury, and Grandview Reserve developments (see locations in [Figure 3.1](#)) were used to estimate development traffic not included in 2040 regional forecasts. Trends-based 20-year growth factors for US 24, the closest state highway facility, were obtained from the CDOT Online Traffic Information System (OTIS) database. The identified growth rates for the segments north of Falcon Highway, north of Woodmen Road, and north of Judge Orr Road were 1.41, 1.58, and 1.45, respectively. This equates to an average 20-year growth factor of 1.48 and a growth rate that ranges from 2.0 to 2.9 percent per year.

Finally, an analysis using the Pikes Peak Area Council of Governments model and industry-standard adjustment procedures, as shown in [Table 3.1](#), was used to calculate unadjusted 2040 forecasts and growth rates for the Eastonville Road corridor segments and cross streets. Calculated growth factors were compared, balanced, and applied to south Eastonville Road (1.43), north Eastonville Road (1.87), west Judge Orr Road (1.10), and east Judge Orr Road (1.24) 2020 intersection volumes to calculate 2040 total traffic intersection volumes. Key intersection 2020 and 2040 volumes are shown in [Figure 3.2](#) and [Figure 3.3](#).

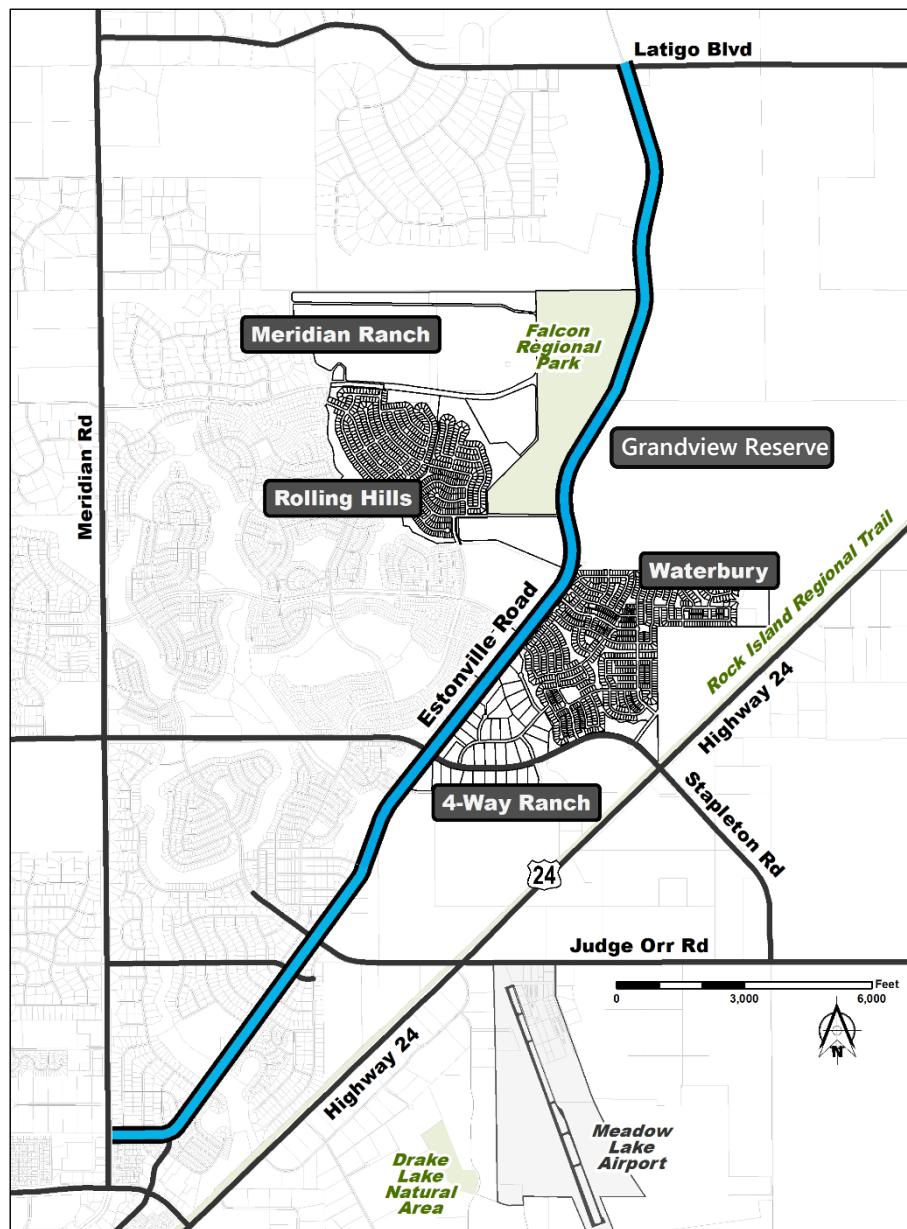

Figure 3.1. Planned Study Area Developments

**Table 3.1. Forecast Background Traffic Growth Rate Calculations**

Segment Location	ADT Volumes										Adjusted 2040 ADT	20-Year Factor	1-Year Factor			
	2020 Count Volumes			PPACG Model Volumes			Difference		% Difference

Note: Count dates denoted with an asterisk (\*) indicate that the ADT volume was estimated from a peak hour intersection turning movement counts collected at the indicated cross street intersection.

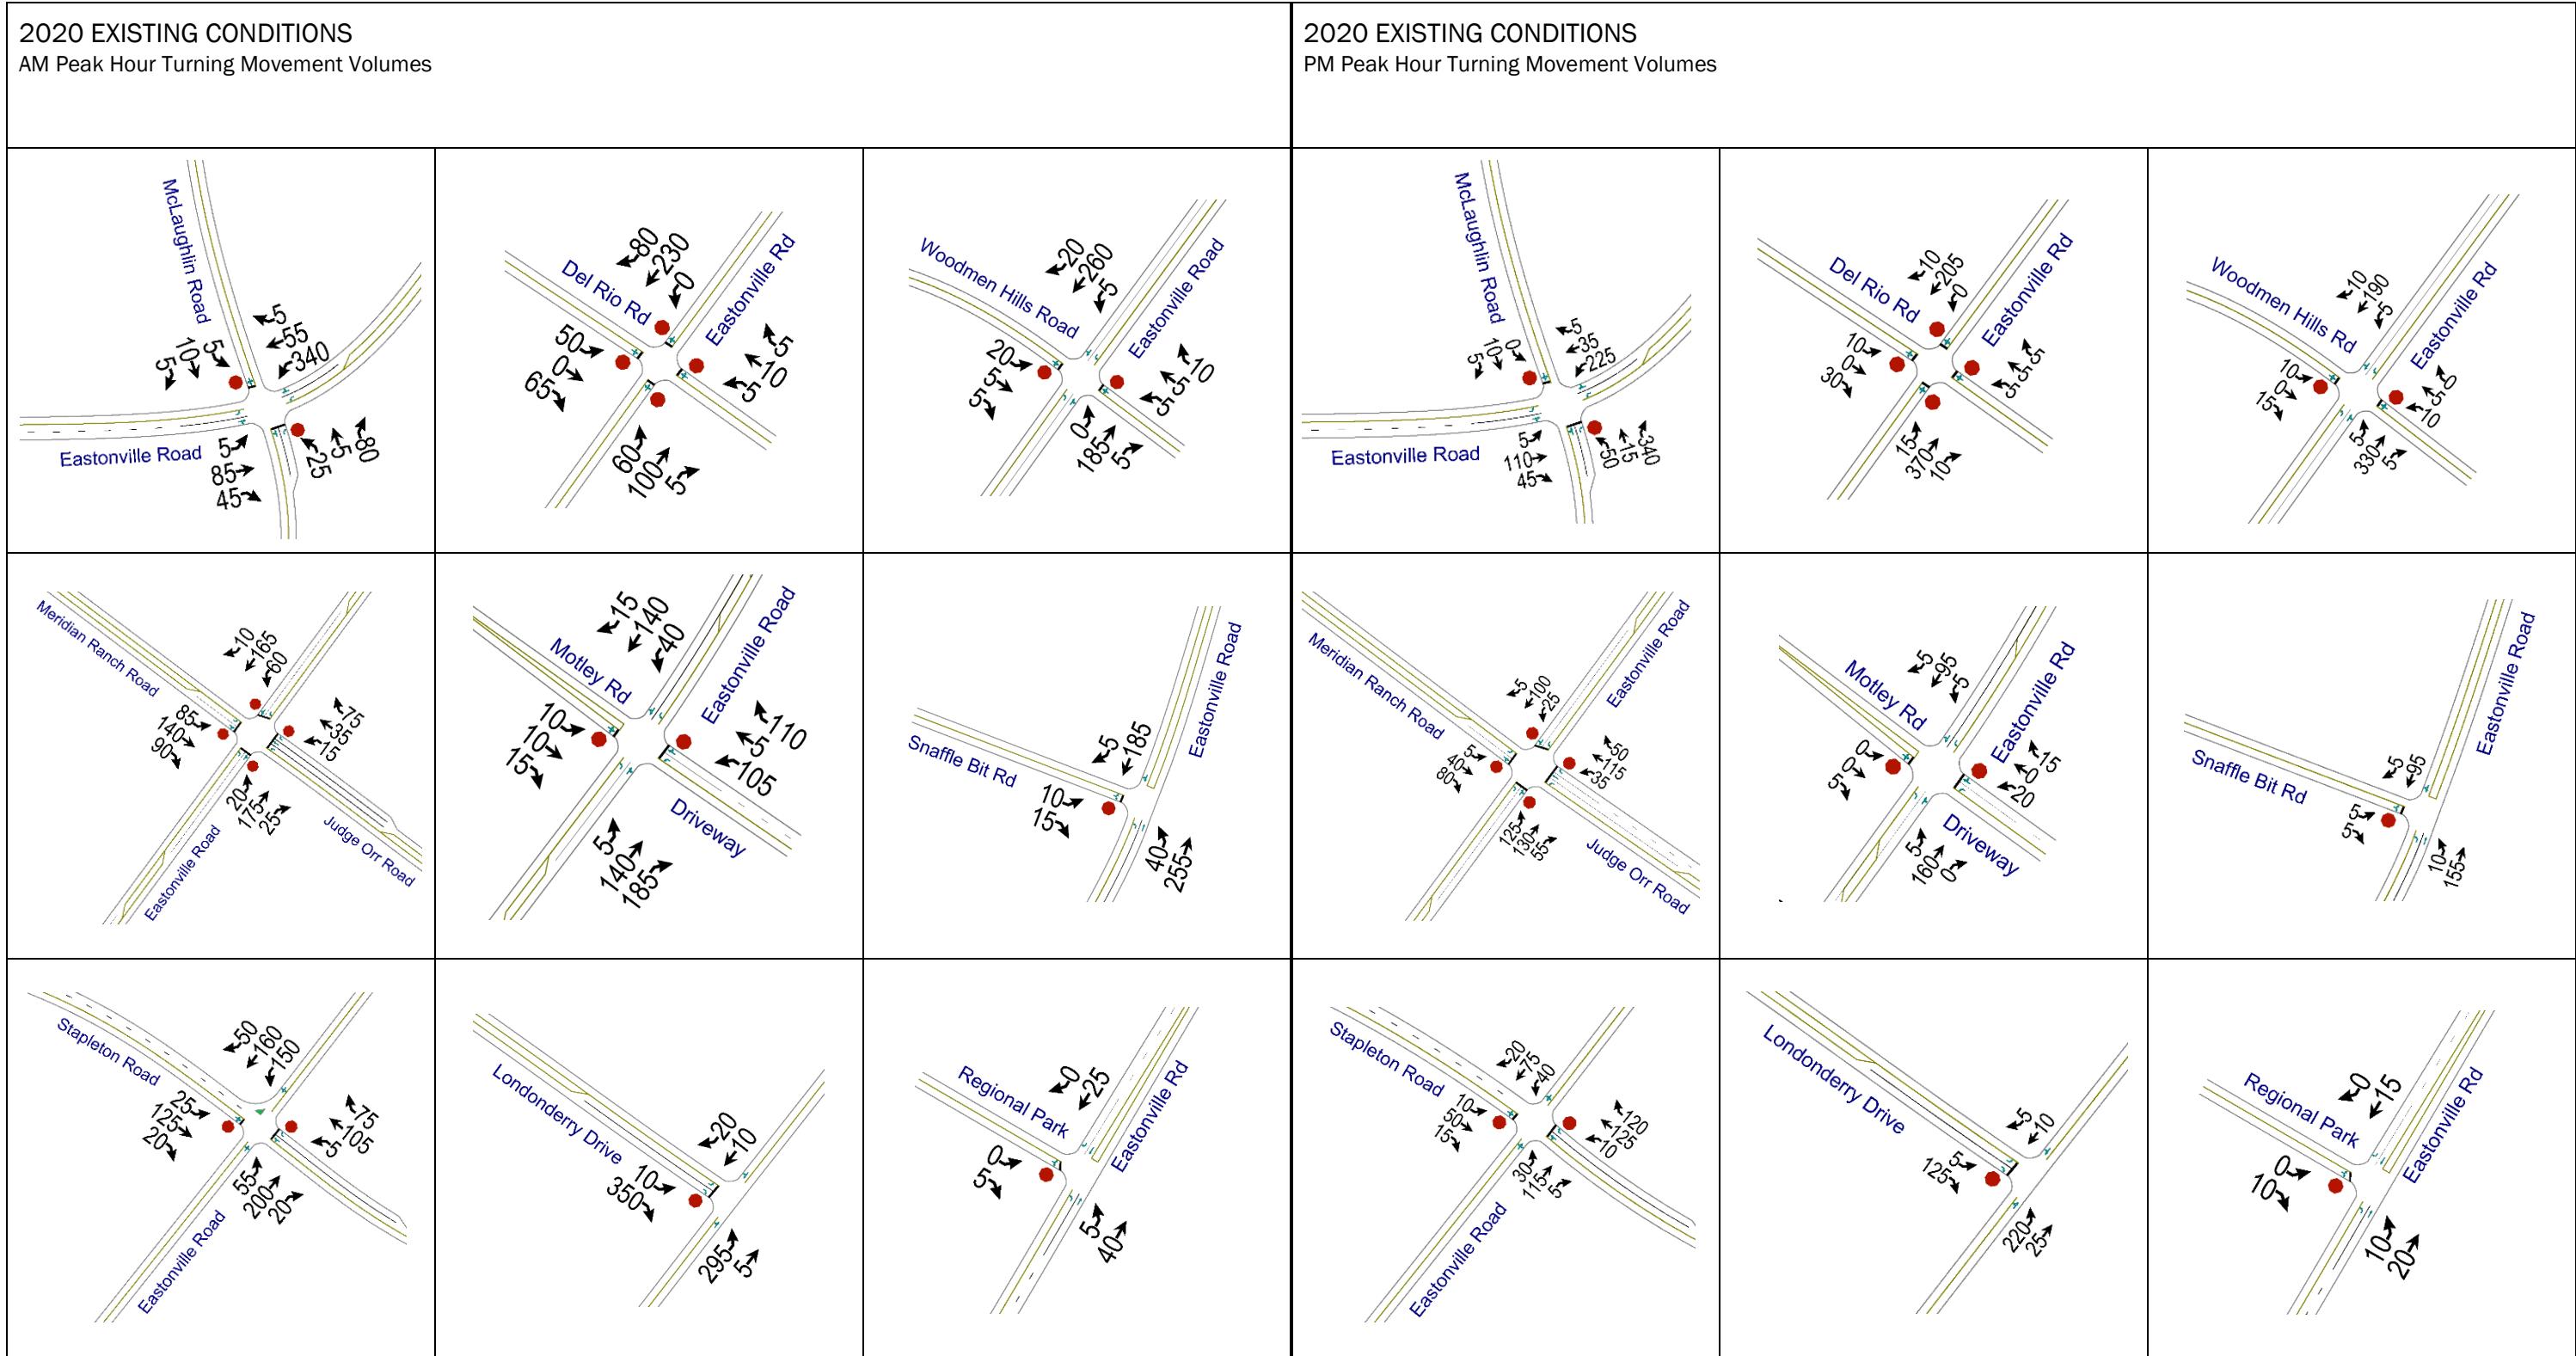

Figure 3.2. 2020 Existing Peak Hour Intersection Volumes

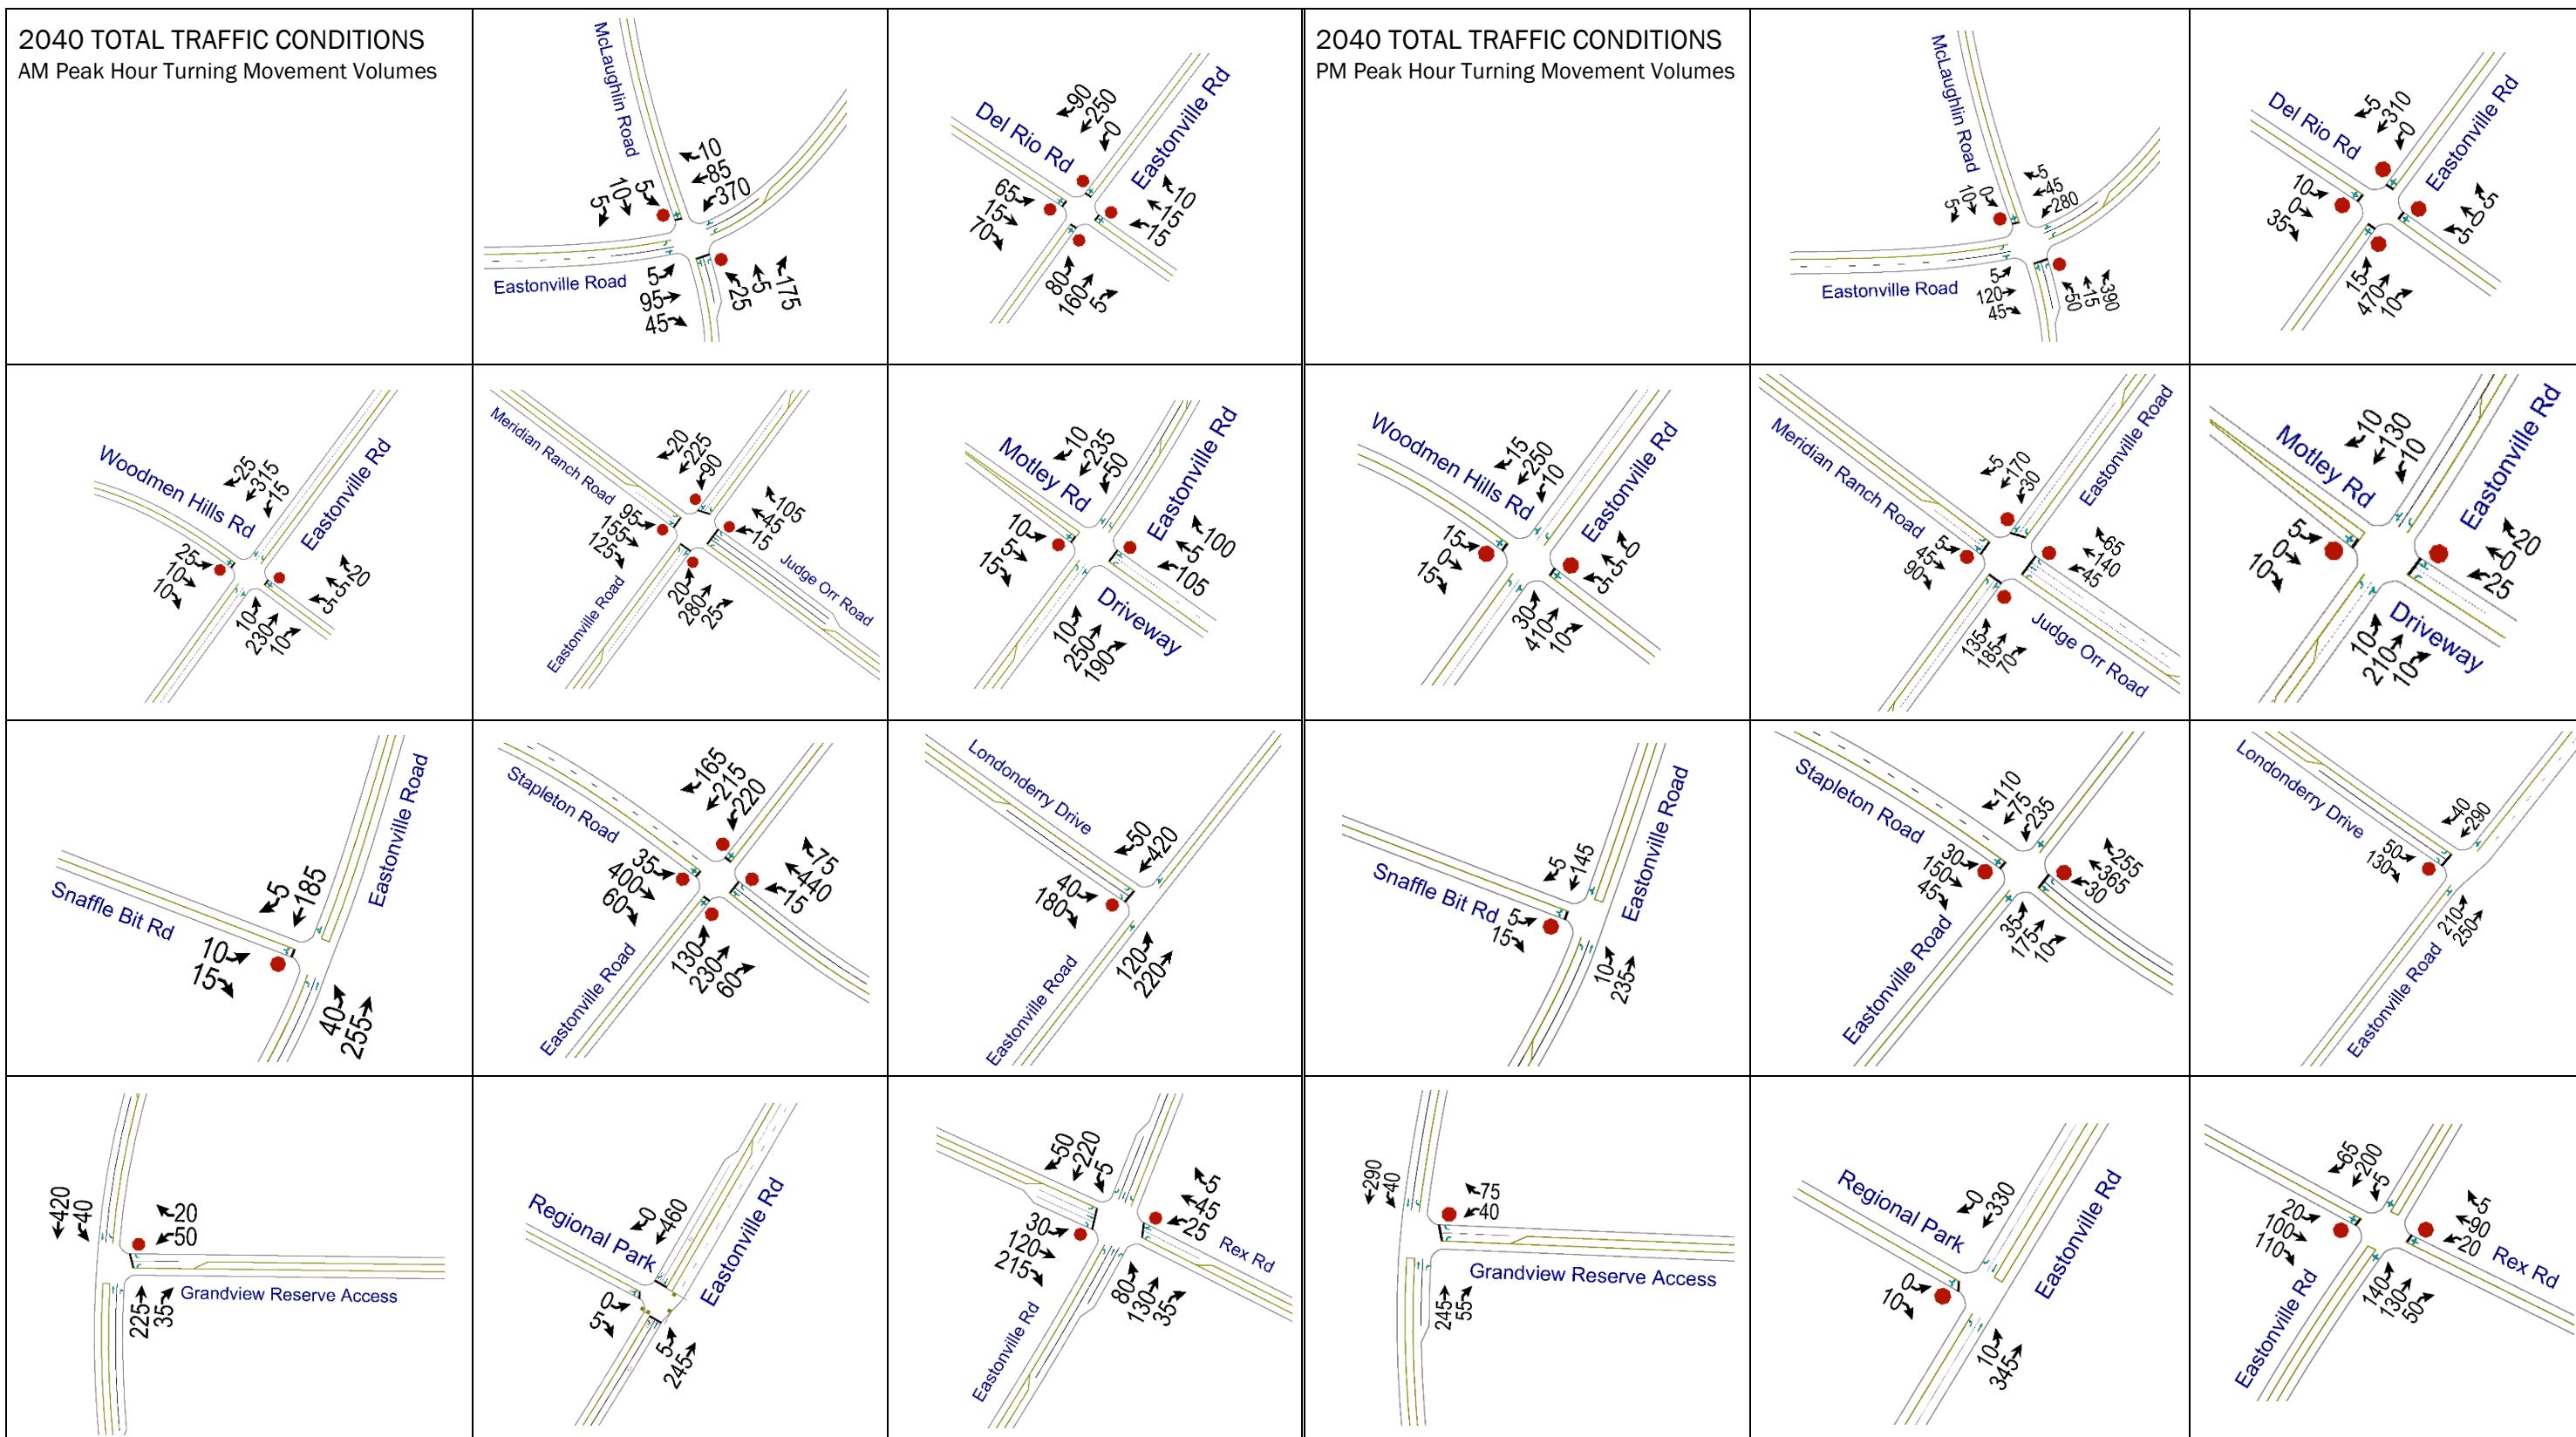

Figure 3.3. 2040 Total Traffic Peak Hour Intersection Volumes

## 4 – SIGNAL WARRANTS ANALYSIS

The Eastonville Road/Judge Orr Road and Eastonville Road/Stapleton Road intersections were evaluated to determine if signal warrants are currently met at either intersection. The Judge Orr Road intersection currently operates at a LOS B under AWSC, while the Stapleton Road intersection operates at a LOS f during the AM peak hour under TWSC (see Table 2.1). As shown in **Table 4.1**, neither the Eastonville Road at Judge Orr Road intersection nor the Eastonville Road at Stapleton Road intersections currently meets any of the nine warrants for signalization. Based on these findings, a traffic signal is not warranted at either intersection at this time. Calculated hourly traffic volumes used for the analysis are included in **Appendix A** and full HCS7 Warrants and Volumes reports are included in **Appendix C**.

Table 4.1. Summary of Signal Warrants Analysis		
Warrant Description	Signal Warrants Met/Not Met	
	Eastonville Rd at Judge Orr Rd	Eastonville Rd at Stapleton Rd
Warrant 1: Eight-Hour Vehicular Volume	No	No
Warrant 2: Four-Hour Vehicular Volume	No	No
Warrant 3: Peak Hour	No	No
Warrant 4: Pedestrian Volume	No	No
Warrant 5: School Crossing	No	No
Warrant 6: Coordinated Signal System	No	No
Warrant 7: Crash Experience	No	No
Warrant 8: Roadway Network	No	No
Warrant 9: Grade Crossing	No	No

Both intersections were also evaluated to determine if AWSC warrants are currently met. As shown in **Table 4.2**, while approaching meeting warrants for AWSC, the Eastonville Road/Stapleton Road intersection does not currently meet warrants for AWSC. The intersection should be monitored as a candidate for interim AWSC implementation should warrants be met in the near term.

Table 4.2. Summary of Eastonville Road/Stapleton Road AWSC Warrants Analysis		
Warrant Description	AWSC Warrants Met/Not Met	
	Notes	Warrant Met
Warrant 1: Meets Signal Warrants		No
Warrant 2: Crash Incidence		No
Warrant 3a: 8-Hour Volume Major Street (300)	Met for only 3 hours, plus 2 hours at 80%	No
Warrant 3b: 8-Hour Volume Minor Street (200)	Met for only 4 hours, plus 2 hours at 80%	No
Warrant 4: 2, 3a & 3b (ALL) 80% Satisfied		No
<b>Additional Applicable Criteria (Optional)</b>		
Need to Control Left-Turn Conflicts		No
Need to Control Pedestrian/Vehicle Conflicts	On route to/from Falcon High School.	Yes
Need to Address Inadequate Sight Distance		No
Residential Collector Operational Issues		No

As shown in **Table 4.3**, AWSC warrants analysis confirms that the 8-Hour Major Street Minimum Volume warrant is currently met for the Eastonville Road/Judge Orr Road intersection that is currently operating under AWSC. Additionally, this intersection is approaching meeting the 8-Hour Minor Street Minimum Volume warrant. Calculated hourly traffic volumes used for the analysis are included as part of **Appendix A**.

One of four optional criteria that may be considered in an engineering study is also potentially applicable at both intersections: The need to control vehicle/pedestrian-bicyclist conflicts near locations that generate high pedestrian volumes. This optional criteria may have been influential in the application of AWSC at the Eastonville Road/Del Rio Road intersection. That intersection serves the elementary school that is accessed from Del Rio Road.

**Table 4.3. Summary of Eastonville Road/Judge Orr Road AWSC Warrants Analysis**

<b>Warrant Description</b>	<b>AWSC Warrants Met/Not Met</b>	
	<b>Notes</b>	<b>Notes</b>
Warrant 1: Meets Signal Warrants		No
Warrant 2: Crash Incidence		No
Warrant 3a: 8-Hour Volume Major Street (300)	Met for only 12 hours, plus 1 hour at 80%	Yes
Warrant 3b: 8-Hour Volume Minor Street (200)	Met for only 5 hours, plus 2 hours at 80%	No
Warrant 4: 2, 3a & 3b (ALL) 80% Satisfied		No
<b>Additional Applicable Criteria (Optional)</b>		
Need to Control Left-Turn Conflicts		No
Need to Control Pedestrian/Vehicle Conflicts	On route to/from schools, park, trails.	Yes
Need to Address Inadequate Sight Distance		No
Residential Collector Operational Issues		No

## 5 – ANALYSIS OF ALTERNATIVES

### 5.1 2020 Near-Term Build Analysis

The Eastonville Road/Stapleton Road intersection is the only intersection within the project corridor that does not operate at a LOS D or better for 2020 traffic volumes, existing roadway geometry and intersection control. This intersection operates under TWSC with STOP control applied to the Stapleton Road minor/cross street approaches. In this existing configuration, the EB, single-lane approach operates as a LOS f during the worst-case AM peak hour. Two alternatives, conversion of the intersection to AWSC and replacement of the intersection with a modern roundabout, were evaluated as 2020 near-term build alternatives. The analysis showed that either alternative would provide a LOS B or better; however, conversion of the intersection to AWSC is recommended as the preferred near-term solution because this alternative could be implemented with minimal disruption and would afford the greatest flexibility to accommodate a yet unidentified long-term solution. Long-term alternatives analysis and selection will focus on identification of a preferred alternative that will be compatible with long-term improvements to both the Eastonville Road (2-Lane Minor Arterial) corridor and the Stapleton Road (4-Lane Principal Arterial) corridor. As shown in **Table 5.1**, conversion of the intersection to AWSC would result in a peak hour overall intersection LOS B or better with 2020 traffic flows.

**Table 5.1. 2020 Near-Term Improvements Traffic Operations Summary**

<b>Control</b>	<b>Intersection</b>	<b>LOS/Delay [in seconds/vehicle] (Critical Movement)</b>	
		<b>AM Peak Hour</b>	<b>PM Peak Hour</b>
TWSC	Eastonville Road & Stapleton Road	f / 66.0 (EB)	b / 14.7 (WB THRU/LT)
AWSC	Eastonville Road & Stapleton Road	B / 14.9	A / 9.2
Roundabout	Eastonville Road & Stapleton Road	A / 5.6	A / 4.1 (NB THRU/LT)

### 5.2 2040 No Build Analysis

The LOS and delay measures shown in **Table 5.2** are for 2040 total traffic flows (including build-out development traffic) and existing roadway geometry and lane utilization. The only exceptions to this were the intersections at Del Rio Road, Judge Orr Road and Stapleton Road. The Stapleton Road intersection was modeled under AWSC for 2040, consistent with a potential 2020 Near-Term Build Alternative. Additionally, the Del Rio Road intersection was evaluated under both AWSC and TWSC, and the Judge Orr intersection was evaluated under current AWSC as well as under TWSC and as a two-lane roundabout. As shown in **Table 5.2**, delays would increase at all corridor intersections with increased 2040 traffic flows. However, all but one project corridor intersection, including those not specifically listed, would continue to operate at an acceptable LOS D or better under existing control. The exception is the Eastonville Road/Stapleton Road intersection, which would drop to a LOS E/F operating under AWSC with 2040 total traffic flows. Analysis of alternative control at Judge Orr Road and Del Rio Road intersection showed that both intersections would operate at a LOS C or better for 2040 background traffic flows and AWSC. Under TWSC, the Del Rio Road and Judge Orr Road intersections would operate at a LOS c and LOS e, respectively. Were either of these intersections converted to a two-lane roundabout, they would operate at a LOS A.

Conversion of the Judge Orr Road and Stapleton Road intersections to a two-lane roundabout or signal should be considered when traffic flows increase to levels that result in LOS performance below a LOS C for AWSC or a LOS e for TWSC. In addition, considerations that should be evaluated when determining appropriate traffic control at intersections include corridor progression and roadway functional classifications.

**Table 5.2. 2040 No-Build Traffic Operations Summary**

Control	Intersection	LOS/Delay [in seconds/vehicle] (Critical Movement)	
		AM Peak Hour	PM Peak Hour
TWSC	Eastonville Road & McLaughlin Road	d / 34.5 (NB THRU/LT)	d / 27.2 (NB THRU/LT)
AWSC	Eastonville Road & Del Rio Road	B / 11.1	B / 13.6
TWSC	Eastonville Road & Del Rio Road	c / 17.5 (EB Approach)	c / 16.2 (EB Approach)
TWSC	Eastonville Road & Woodmen Hills Drive	c / 15.3 (EB Approach)	c / 18.9 (EB Approach)

### 5.3 2040 Total Traffic Build Analysis

The LOS and delay measures shown in **Table 5.3** are for 2040 total traffic flows (including development traffic) and upgraded roadway geometry and lane utilization. Intersection control for all corridor intersections except the Eastonville Road/Stapleton Road intersection remains unchanged from the existing condition. That intersection was evaluated both as a signalized intersection and a two-lane modern roundabout. While preferred AWSC near-term alternative would operate at a LOS F (see **Section 5.2**), either of these higher-capacity alternatives would operate at a LOS C or better with 2040 total traffic flows.

The geometric improvements included in the 2040 Total Traffic Build scenarios are: the addition of dedicated left-turn lanes at all intersections (integral to proposed three-lane cross section); the addition of a dedicated right-turn and left-turn lanes on the eastbound (EB) Stapleton Road approach to the Eastonville Road/Stapleton Road intersection; and the addition of right-turn lanes on the EB and WB approaches to the Eastonville Road/Rex Road intersection. Additionally, the proposed access to the Grandview Reserve development from Eastonville Road was configured with a NB right-turn lane, SB left-turn lane, and WB right-turn lane. This is the configuration that was shown in the submitted traffic impact studies for Grandview Reserve and Rolling Hills. As shown in **Table 5.3**, all corridor intersections, or critical movements/approaches, operate at a LOS D or better for 2040 total traffic flows and the identified intersection-specific control and geometric improvements.

Conversion of the Judge Orr Road and Stapleton Road intersections to a roundabout or signal should be considered when warrants are met or when traffic flows increase to levels that result in LOS performance below a LOS C for AWSC or a LOS e for TWSC. In addition, considerations should be evaluated when determining appropriate traffic control at intersections include corridor progression and roadway functional classifications.

**Table 5-3.** 2040 Total Traffic Build Traffic Operations Summary

	Intersection	LOS/Delay [in seconds/vehicle] (Critical Movement)	
		AM Peak Hour	PM Peak Hour
TWSC	Eastonville Road & McLaughlin Road	d / 34.5 (NB THRU/LT)	d / 27.9 (NB THRU/LT)
AWSC	Eastonville Road & Del Rio Road	B / 11.2	B / 13.8
TWSC	Eastonville Road & Del Rio Road	c / 18.0 (EB Approach)	c / 16.1 (EB Approach)
TWSC	Eastonville Road & Woodmen Hills Drive	c / 15.4 (EB Approach)	c / 18.1 (EB Approach)
TWSC	Motley Road & Eastonville Road	d / 25.2 (WB Approach)	b / 12.3 (WB Approach)
AWSC	Eastonville Road & Judge Orr Road	C / 22.4	B / 13.3
TWSC	Eastonville Road & Judge Orr Road	e / 41.4 (EB LT)	e / 35.9 (EB LT)
Roundabout	Eastonville Road & Judge Orr Road	A / 5.3	A / 4.7
TWSC	Eastonville Road & Snaffle Bit Road	b / 12.8 (EB Approach)	a / 9.9 (EB)
Signal	Eastonville Road & Stapleton Road	C / 20.7	B / 17.9
Roundabout	Eastonville Road & Stapleton Road	B / 10.8	A / 8.6
TWSC	Eastonville Road & Londonderry Road	c / 23.1 (EB LT)	d / 29.8 (EB LT)
TWSC	Eastonville Road & Grandview Reserve	c / 17.3 (WB LT)	b / 14.8 (WB LT)
TWSC	Eastonville Road & Rex Road	d / 32.9 (WB LT)	d / 32.0 (WB LT)
TWSC	Eastonville Road & Falcon Regional Park	b / 11.4 (EB Approach)	b / 10.3 (EB Approach)

Timing of phased build-out of new development within the study area is unknown. In order to gauge when additional upgrade to the Eastonville Road/Stapleton Road intersection might be needed, a demand sensitivity analysis was conducted. For this analysis incremental development build-out shares were calculated as the present between 2020 traffic flows and 2040 total traffic flows. The calculated development traffic was added to 2020 volumes and then evaluated under AWSC. The analysis scenarios began with 20% build-out of planned development. Increments of 5% additional development traffic were added. The results of the analysis (see **Table 5.4**) show that the AM peak hour would be most affected, and that 30 percent and 40 percent build-out of new development would bring the intersection to a LOS E and a LOS F, respectively, during the AM peak hour.

**Table 5.4.** Eastonville Road/Stapleton Road LOS versus Development Build-Out Level

	Intersection LOS/Delay (in seconds/vehicle)				
	20% Build-Out	25% Build-Out	30% Build-Out	35% Build-Out	40% Build-Out
AM Peak Hour	C / 24.3	D / 29.7	E / 39.0	E / 46.6	F / 57.5
PM Peak Hour	B / 10.5	B / 11.0	B / 11.4	B / 11.9	B / 12.5

## 6 – CONCLUSIONS AND RECOMMENDATIONS

### 6.1. Roadway Improvement Recommendations

The roadway cross section, surface and drainage facilities varies throughout the corridor. These differences were important considerations in determining near-term and long-term improvement implementation priorities.

#### 6.1.1 Existing Roadway Characteristics

Eastonville Road traffic flows currently range from a high of 2,600 ADT at the southern end of the corridor to a low of 200 ADT at the northern end of the corridor. By 2040, traffic flows are expected to increase to 4,800 ADT and 5,400 ADT on the northern and southern portions of the project corridor, respectively. Existing and forecast traffic volumes can be accommodated by two travel lanes, one in each direction.

The Eastonville Road project corridor is currently configured as a two-lane roadway with variable cross sections. The roadway segments between McLaughlin Road and Comeapart Road and between Tibbs Road and Snaffle Bit Road are paved and configured as three-lane sections with two-way center left-turn lanes and curb and gutter. The segments between Comeapart Road and Tibbs Road and between Snaffle Bit Road and Londonderry Drive are paved and configured as two-lane sections with rural roadside drainage. The segment between Londonderry Drive and Latigo Boulevard exists as an unpaved, two-lane roadway with rural roadside drainage. Recommended roadway improvements will bring the full corridor to a uniform standard. The recommended urban section combines elements of the County's urban minor arterial and urban nonresidential collector standards and includes detached trail segments/meandering sidewalks.

#### 6.1.2 Roadway Improvement Recommendations

It is recommended that near-term roadway improvements implement the recommended urban section across the full project corridor. To achieve that goal, improvements should include upgrades to the following existing rural segments: 1) between Comeapart Road and Tibbs Road; 2) between Snaffle Bit Road and Londonderry Drive; and 3) between Londonderry Road and Rex Road Comeapart Road and Tibbs Road.

Upgrades to the existing urban roadway segments to create a consistent section, between McLaughlin Road and Comeapart Road and between Comeapart Road and Snaffle Bit Road could be implemented with after upgrades to the segments with existing rural sections. While improvements to the urban sections are integral to achieving functional consistency as well as pedestrian facilities connectivity, improvements to these segments could be completed in a later corridor improvements phase with minimal effect on either roadway function or capacity.

Improvements to the rural corridor segment between Rex Road and Latigo Boulevard may also occur later, as this northern segment of the corridor develops.

### 6.2 Intersection Improvement Recommendations

#### 6.2.1 Near-Term Intersection Improvements

All but two corridor intersections operate at a LOS C or better for 2020 traffic flows. The exceptions are the TWSC intersections at McLaughlin Road and Stapleton Road that operate at AM/PM peak hour LOS d/c and f/b for 2020 traffic flows, respectively. The McLaughlin Road intersection does not require near-term improvements. Although the Stapleton Road intersection does not meet warrants for AWSC at this time, traffic flow through the intersection is increasing and current traffic levels approach meeting minimum volume warrants for AWSC. For these reasons, it is recommended that the intersection at Stapleton Road intersection be monitored and that either near-term or long-term improvements be considered accordingly.

### Stapleton Road Intersection

Conversion of the intersection to AWSC and replacement of the traditional intersection with a modern roundabout were evaluated as intersection upgrades for existing traffic flows, and both alternatives were considered as near-term solutions. The analysis showed that under AWSC the intersection would operate at a LOS B and a LOS A during the AM peak hour and PM peak hour, respectively, and that a modern roundabout the intersection would operate as a LOS A during both the AM and PM peak hours. While either alternative would provide a LOS B or better for 2020 traffic flows, the conversion of the intersection to AWSC could be implemented quickly and cost-effectively and would afford flexibility to accommodate long-term improvements compatible with yet-to-be-identified long-term improvements to Stapleton Road. For these reasons, conversion to AWSC is recommended as the preferred near-term, as-needed intersection upgrade.

#### 6.2.2 Long-Term Intersection Improvements

Phased extension of the standard three-lane cross section to the entire corridor will add dedicated left-turn lanes at all Eastonville Road intersection approaches. Dedicated right-turn and left-turn lanes on the EB Stapleton Road intersection approach as well as dedicated right-turn lanes the EB and WB Rex Road intersection are also included as part of recommended near-term and long-term roadway improvements. With these improvements, all intersections except the intersections at McLaughlin Road and Stapleton Road will operate at a LOS C or better for 2040 traffic flows and existing intersection controls. The TWSC McLaughlin Road intersection will operate at an acceptable LOS d (NB thru/left-turn) for 2040 traffic flows but may need long-term improvements. Near-term conversion of the Stapleton Road intersection to AWSC, or an alternative intersection control, are needed to provide an acceptable LOS D or better for 2020 traffic flows, and additional improvements to this intersection will be needed to adequately serve 2040 traffic flows.

### McLaughlin Road Intersection

The McLaughlin Road intersection serves commercial land uses and is likely to become increasingly congested. At some point, the capacity of this intersection under TWSC will be inadequate to process increasing traffic flows. The proximity of this intersection to the signalized intersection at Meridian Road may weigh against the feasibility of signalizing the intersection or converting the intersection to AWSC operations. While the selection of a preferred alternative for this intersection should be determined through additional analysis to be conducted as part of preliminary engineering and final design phases, it is recommended that conversion of this intersection to a modern roundabout be given consideration.

### Stapleton Road Intersection

In the future, the capacity of the intersection of Stapleton Road at Eastonville Road, whether under TWSC or AWSC, will be inadequate to process increased traffic flows associated with growth in background traffic and phased build-out of planned development along the Eastonville Road corridor. Given that the pace of planned development build-out is uncertain, sensitivity analysis was conducted to determine how much additional development traffic could be accommodated by a higher capacity AWSC upgrade. The analysis showed that during the worst-case AM peak hour, the LOS under AWSC would drop to a LOS E and LOS F with 30 percent and 40 percent build-out of planned development, respectively. Traffic volume forecasts for each development build-out scenario and Synchro analysis reports for the sensitivity analysis are included as **Appendix F**. Traffic operations for a signalized intersection and a two-lane modern roundabout were evaluated as ultimate upgrades to handle increased long-term traffic flows. The analysis showed that either alternative would operate at a LOS C or better for 2040 traffic flows. The selection of the ultimate alternative for this intersection will be determined through additional analysis as a part of the preliminary engineering and final design phases for the Eastonville Road and Stapleton Road corridors.

## List of Acronyms and Definitions

### All-Way Stop Controlled (AWSC)

All intersection approaches are controlled by STOP signs.

### AM

Refers to the morning weekday peak traffic period, which includes primarily work and school trips.

### Average Daily Traffic (ADT)

The amount of vehicular traffic that crosses an imaginary line across a roadway in a 24-hour period. ADT information typically includes both directions of vehicle travel (if on a two-way street). When the term ADT is used specifically to mean typical weekday traffic, it is often called Average Weekday Daily Traffic (AWDT).

### Colorado Department of Transportation (CDOT)

The Colorado Department of Transportation Online Traffic Information System (OTIS) was used as a data source for historical trends-based annual and 20-year traffic growth factors. CDOT has jurisdiction over Colorado's State Highway System, including facilities within the project study area.

### Eastbound (EB)

Refers to one-way traffic flowing from the west to the east and the lanes that carry such traffic.

### Gap in Traffic

A gap in traffic is the space between vehicles approaching the pedestrian crossing. Gaps are typically measured in seconds, not distance, as it is the length of the gap in time in which a pedestrian must be able to cross the street. A directional gap is the gap between vehicles approaching in a single direction. A directional gap can be measured between vehicles in a single lane or between vehicles approaching in the same direction but in different lanes on a multi-lane approach. If there is no median refuge at the crossing, a pedestrian will need to find an acceptable gap in traffic approaching from two directions at once. This is much more challenging than finding a gap in each approach direction separately.

### *Highway Capacity Software Version 7 (HCS7)*

*Highway Capacity Software Version 7* is the current version of software used to compute *Highway Capacity Manual* measures of capacity and quality of service of highway facilities, including freeways, highways, arterial roads, roundabouts, signalized and unsignalized intersections, rural highways, and the effects of mass transit, pedestrians, and bicycles on the performance of these systems.

### *Highway Capacity Manual (HCM)*

The *Highway Capacity Manual* is a publication of the U.S. Transportation Research Board of the National Academies of Science. It contains concepts, guidelines, and computational procedures for computing the capacity and quality of service of various highway facilities, including freeways, highways, arterial roads, roundabouts, signalized and unsignalized intersections, rural highways, and the effects of mass transit, pedestrians, and bicycles on the performance of these systems. The *Highway Capacity Manual (HCM2010)* and *Highway Capacity Manual Sixth Edition (HCM6)* were used as part of this study.

### Lane

A portion of the roadway surface designated for motor vehicle travel, typically in a single direction, that is delineated by pavement marking stripes. Types of lanes include: "through lanes" for travel along the length of the roadway, often through intersections; "turn lanes," which are typically on

intersection approaches and provide space for left or right turning motorists; and “bike lanes,” which are designated for bicycle travel in the same direction as the automobile travel, typically narrower than vehicle lanes, and usually located along the outside edges of the roadway.

**Left Turn (LT)**

Refers to traffic that turns left at an intersection, often using a designated left-turn lane, and sometimes afforded a dedicated left-turn phase in traffic signal timing.

**Level of Service (LOS)**

A qualitative measure used to relate the quality of traffic service. LOS is used to analyze highways by categorizing traffic flow and assigning quality levels of traffic based on performance measures such as speed, density, and so forth.

**Metropolitan Planning Organization (MPO)**

A Metropolitan Planning organization is a federally mandated and federally funded transportation policy-making organization that is composed of representatives from local government and governmental transportation authorities. MPOs were introduced by the Federal-Aid Highway Act of 1962, which required the formation of an MPO for any urbanized area with more than 50,000 residents.

**Miles per Hour (mph)**

Refers to travel speed or posted speed limit.

**National Cooperative Highway Research Program (NCRHP)**

The National Cooperative Highway Research Program is a forum for coordinated and collaborative research, addressing issues integral to the state departments of transportation and transportation professionals at all levels of government and the private sector.

**Northbound (NB)**

Refers to traffic flowing from the south towards the north and the lanes that carry such traffic.

**Online Transportation Information System (OTIS)**

OTIS is a publically available website maintained by the Colorado Department of Transportation, providing information on current and projected traffic volumes, state highway attributes, summary roadway statistics, demographics, and geographic data.

**Pikes Peak Area Council of Governments (PPACG)**

The Pikes Peak Area Council of Governments is a voluntary organization of municipal and county governments serving as the federally mandated Metropolitan Planning Organization serving El Paso County, Park County, Teller County, Alma, Calhan, Colorado Springs, Cripple Creek, Fairplay, Fountain, Green Mountain Falls, Manitou Springs, Monument, Palmer Lake, Ramah, Victor, and Woodland Park.

**PM**

Refers to the afternoon/evening weekday peak traffic period, which includes work trips plus other trip types.

**Right Turn (RT)**

Refers to traffic that turns right at an intersection, sometimes using a designated right-turn lane.

**Southbound (SB)**

Refers to traffic flowing from the north towards the south, and the lanes that carry such traffic.

**Through/Left Turn (THRU/LT)**

Refers to traffic (and the lane that carries it) at an intersection that is continuing forward straight through without turning, together with traffic that turns left at the intersection.

**Through/Right Turn (THRU/RT)**

Refers to traffic (and the lane that carries it) at an intersection that is continuing forward straight through without turning, together with traffic that turns right at the intersection.

**Two-Way Stop Controlled (TWSC)**

Cross street minor approaches are controlled by STOP signs.

**Turning Movement Counts (TMCs)**

Traffic counts for a given time interval that specify the number of vehicles that turn left or right as well as the number of vehicles that proceed straight forward through the intersection.

**Vehicle Queue**

A line of stopped vehicles in a single travel lane, commonly caused by traffic control at an intersection.

**Westbound (WB)**

Refers to one-way traffic flowing from the east to the west and the lanes that carry such traffic.
